

LINE HEATER

Indirect line heaters are normally installed upstream of surface production equipment to preheat the well stream and prevent the formation of natural gas/water hydrates associated with pressure reduction. Line heaters also ensure good gas/liquid separation by elevating inlet temperatures.

DEHY UNIT

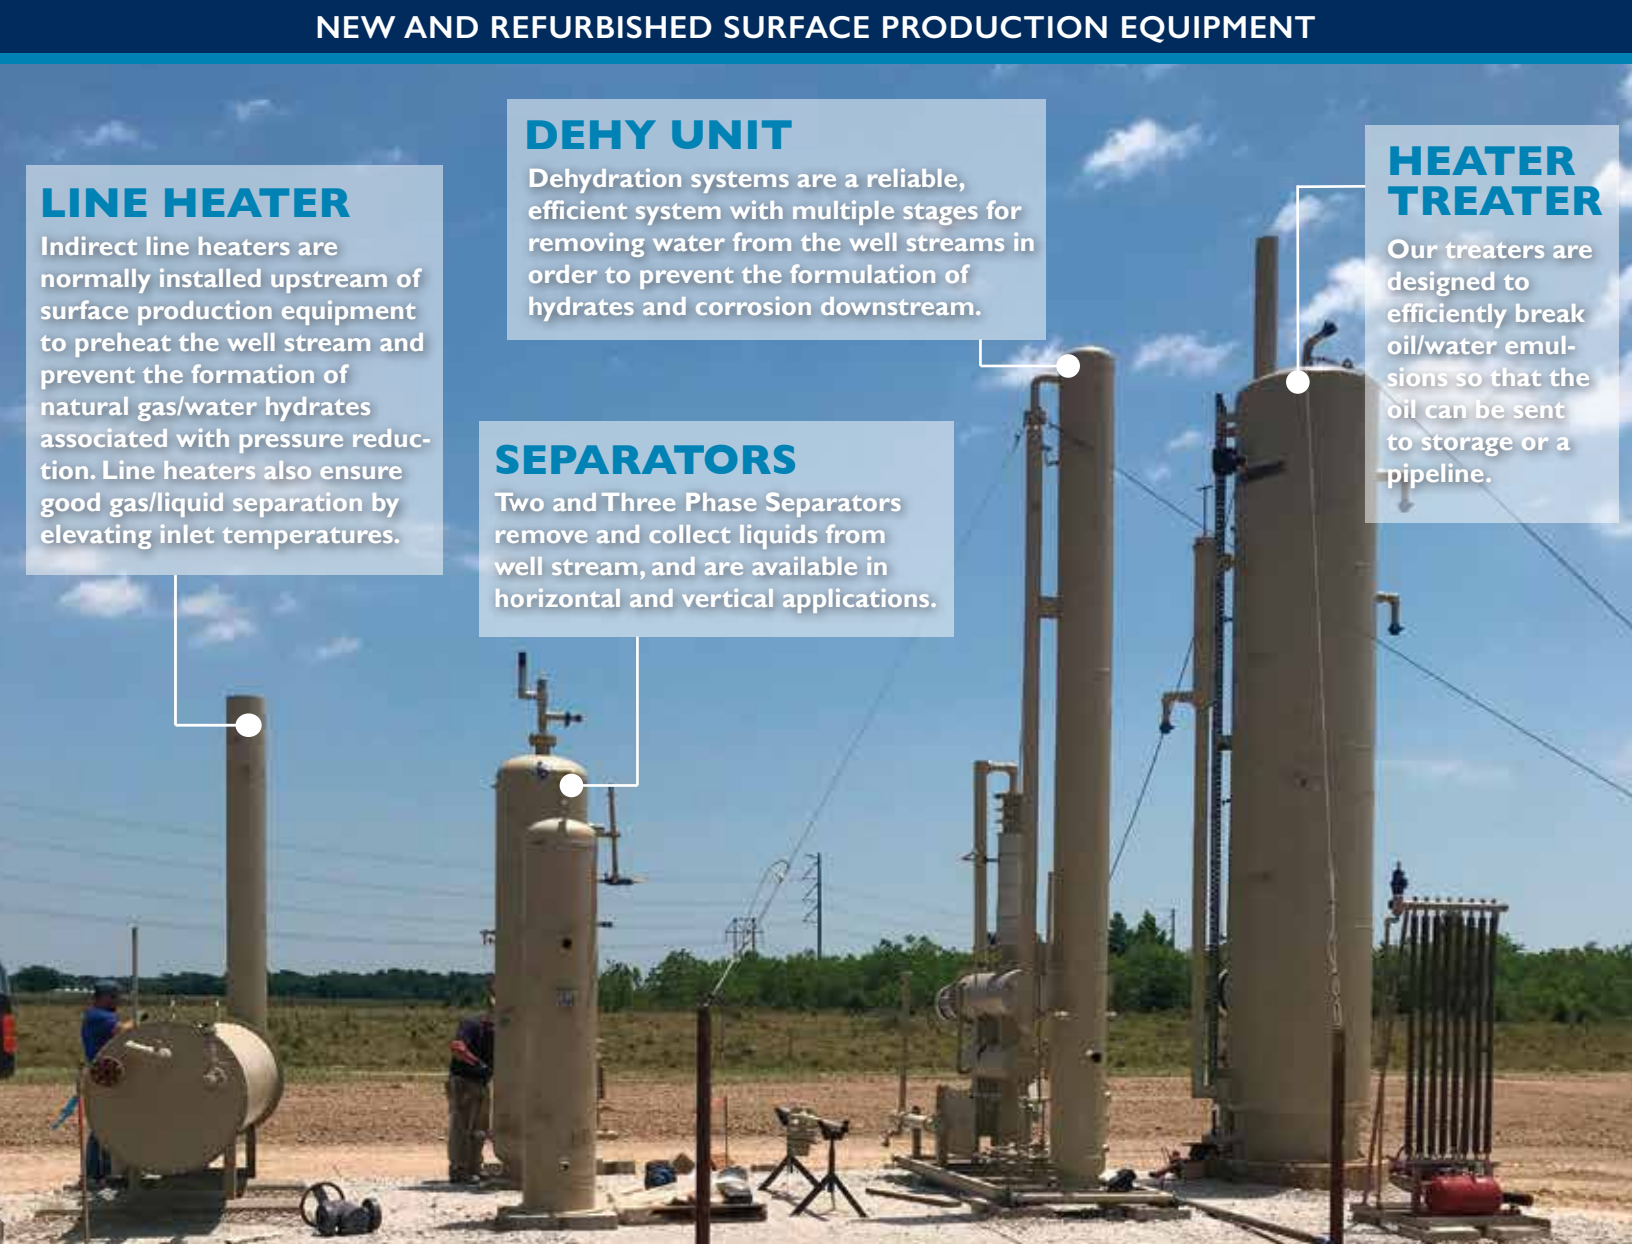

Dehydration systems are a reliable, efficient system with multiple stages for removing water from the well streams in order to prevent the formulation of hydrates and corrosion downstream.

HEATER TREATER

Our treaters are designed to efficiently break oil/water emulsions so that the oil can be sent to storage or a pipeline.

SEPARATORS

Two and Three Phase Separators remove and collect liquids from well stream, and are available in horizontal and vertical applications.

SEPARATOR

3 phase production package or flow back package designs.

METER RUN

Meter runs are designed and available for all flow measurement applications.

FEATURES AND BENEFITS

Certificate of Compliance

Fit for service report

Quick Turnaround

1 year warranty on refurbished

Client owned assets repaired and stored
